1.0 INTRODUCTION

This Stormwater Management Report is prepared in conjunction with plans entitled; “Preliminary and Final Site Plan for Mars Incorporated Proposed Trailer Parking Lot, Block 4, Lot 1, Town of Hackettstown, County of Warren, State of New Jersey” prepared by **SUBURBAN CONSULTING ENGINEERS, INC.** (SCE), dated March 28, 2019. The proposed project includes the demolition of an existing wastewater treatment facility, and the construction of a trailer parking lot, retaining walls, landscaping, and stormwater management measures. Due to the proposed increase of impervious coverage a stormwater detention system will be installed to reduce the peak flows of the 2-year, 10-year and 100-year storms to 50%, 75%, and 80%, respectively, of the predeveloped flows leaving the site.

The subject project is known as Block 4, Lot 1 as identified on the Town of Hackettstown Tax Maps (Sheet 5) and is located at 700 High Street. The entire property consists of approximately 61.6 acres, total. This report is prepared to address the stormwater management design and soil erosion and sediment control requirements for the proposed site improvements which includes a trailer parking lot, retaining walls, landscaping, and stormwater management measures.

The project area for the purpose of this drainage report will be the existing wastewater treatment plant which is approximately 3.87 acres in area. The site is bound by Hackettstown Brook to the west, the M&M Mars building and associated parking to the north, railroad tracks to the south, and continuation of the demolished wastewater treatment plant footprint to the east.

1.1 Existing Conditions

The project area, under existing conditions, contains compacted gravel and structures associated with the wastewater treatment plant, as well as small areas of lawn, pavement and sidewalks. The project area is comprised of two (2) distinct drainage areas: EDA-1 (DET.), which generates flow from the area of the proposed trailer parking lot, and will be routed to Design Point #1 located at the Hackettstown Brook downstream of the site, and EDA-1 (UNDET.), which generates flow from the remaining area of the project site and also drains towards Design Point #1. Per the NRCS Soils Map (please see Appendix A of this report), existing conditions are modeled as hydrologic soil group (HSG) ‘D’ and good conditions are assumed. The existing time of concentration was determined to be less than six (6) minutes and therefore the minimum time of concentration of six (6) minutes (0.1 hour) was utilized per TR-55 guidance. An Existing Drainage Area Map can be found in Appendix I of this report.

A previous site plan application to the Town of Hackettstown, prepared by Dynamic Engineering, dated October 15, 2014, revised through April 3, 2015, and memorialized at the Town of Hackettstown Zoning Board of Adjustment on December 16, 2014, proposed the demolition of various impervious areas of the existing wastewater treatment plant, reverting these areas back to pervious areas. For purposes of this report, the land coverage utilized for the existing conditions reflect the proposed conditions of the Dynamic site plan set.

1.2 Proposed Conditions

The project proposes to construct parking for trailers at the Mars Facility. Three (3) existing tanks are to remain on-site until no longer needed, at which time extra parking spaces will be developed in their place. The proposed construction is considered a major development, and therefore, per the New Jersey Department of Environmental Protection (NJDEP) Stormwater Rules, a drainage analysis was completed to evaluate the need for stormwater attenuation measures. One (1)

underground detention basin is proposed in order to meet the allowable flows for the detained drainage area. PDA-1 (DET.) generates flow from the post-construction trailer parking lot and will be routed to Design Point #1. PDA-1 (UNDET.) generates flow from the remaining area of the project site and also drains towards Design Point #1. A Proposed Drainage Area Map can be found in Appendix I of this report. A minimum six (6) minute (0.1 hour) time of concentration was utilized for the design per TR-55 guidance.

2.0 DESIGN REGULATIONS

2.1 NJDEP Stormwater Management Regulations (SWM)

In accordance with the NJDEP Stormwater Management Regulations, a major development is any "development" that disturbs one (1) or more acres of land or increases impervious coverage by one-quarter acre or more. Since the project disturbs over an acre of land, the project is considered a major development and must meet NJDEP Stormwater Management rules with regards to design and performance standards for stormwater management measures.

Per the NJDEP Best Management Practices (BMP) manual, the underground basin will be protected by an easement to prevent its neglect, adverse alteration, or removal.

2.2 NJDEP Flood Hazard Area (FHA) Regulations

The site is located within the Flood Hazard Area (FHA) of the Hackettstown Brook. The FHA Design Flood Elevation for the project was determined utilizing Method 6 per NJAC 7:13-3.

An FHA Individual Permit (IP) has been applied for at NJDEP in March 2019, and approval is pending per NJDEP review. Once the project's IP is approved, a copy of the approval will be sent to the Town of Hackettstown for filing. Please see Section 3.2 below for more information on the proposed design in regard to compliance with NJDEP FHA regulations.

2.3 Town of Hackettstown

Town of Hackettstown has adopted the NJDEP Stormwater Rules for major developments, and per the Ordinance, "stormwater management measures for major developments shall be developed to meet the erosion control, groundwater recharge, stormwater runoff quantity, and stormwater runoff quality standards." As stated above, the project disturbs over an acre of land, is considered a major development and must meet NJDEP Stormwater Management Rules with regards to design and performance standards for stormwater management measures.

2.4 Soil Erosion and Sediment Control

The project is also required to comply with the Soil Erosion and Sediment Control Standards for New Jersey. These standards outline specific requirements for minimizing soil erosion both during and after construction is complete. The project disturbs more than 5,000 square feet and, therefore, will need to be certified by the Warren County Soil Conservation District (WCSCD). Additionally, the project disturbs more than one (1) acre and, therefore, a NJDEP Request for Authorization (RFA) will also be required.

3.0 DESIGN METHODOLOGY

3.1 Computer Software

Computer software (PondPack V8i by Bentley Haestad Solutions) was utilized to model stormwater runoff rates and hydrograph volumes for the 2-year, 10-year and 100-year storm

events. PondPack uses the TR-55 method to route stormwater models. Runoff curve number (CN) values were chosen based upon for the appropriate land cover.

| Land Cover | CN Value |
|---------------------------------|----------|
| Pervious Industrial (Soil D) | 93 |
| Other Impervious | 98 |

3.2 NJDEP FHA Regulation Compliance

Per the NJDEP FHA regulations stated in NJAC 7:13-11.4, the proposed flood storage volume shall be greater or equal to the existing flood storage volume onsite for both the volume between the FHA design flood and the 10-year flood, and the volume between the 10-year flood and the ground. The majority of the proposed project lies above the 10-year flood elevation, so the volume between the 10-year flood and the ground remains the same under proposed conditions. Per the proposed FHA Flood Volume Exhibits (please see Appendix F of this report), the proposed project creates volume between the FHA design flood and 10-year flood elevations, and therefore complies with the NJDEP FHA regulations.

With regards to the underground detention basin design, per NJAC 7:13-12.2, a backflow preventer device will be utilized on the discharge 15" pipe of the underground detention basin, downstream of the water quality device. This will prevent any flood waters from backing up the pipe into the basin and the water quality structure. In addition, a tailwater condition has been modeled at the crown of the 15" outlet pipe (inv. elev = 561.90; tailwater elev = 563.15).

In addition to the proposed construction creating additional flood storage as part of the project, it should also be noted that the project site is bound to the west by Hackettstown Brook, to the north by an elevated driveway, and to the south by elevated train tracks. The entire FHA design flood elevation is within the project site, so when flooding will occur, it will be fully contained within the project site; the additional flood storage will also assist in alleviating flooding downstream of the project site.

4.0 DESIGN RESULTS

4.1 Stormwater Quantity

In accordance with N.J.A.C. 7:8-5.4-(a)3, stormwater runoff will be reduced utilizing the following options:

(Hydrograph Method)

- i. Demonstrate through hydrologic and hydraulic analysis that for stormwater leaving the site, post-construction runoff hydrographs for the two, 10 and 100-year storm events do not exceed, at any point in time, the pre-construction runoff hydrographs for the same storm events;

(Reduction Method)

- i. Design stormwater management measures so that the post-construction peak runoff rates for the 2, 10 and 100-year storm events are 50, 75 and 80 percent, respectively, of the pre-construction peak runoff rates. The percentages apply only to the post-construction stormwater runoff that is attributable to the portion of the site on which the proposed development or project is to be constructed.

In order to comply with the applicable regulations, the site will include an underground detention basin. The proposed underground detention basin will provide stormwater quantity reductions to meet the NJDEP requirements. The proposed development located within the detained PDA-1 (DET.) drainage areas will comply with the NJDEP regulations utilizing the ‘Reduction Method.’ The undetained PDA-1 (UNDET.) drainage areas will comply with the NJDEP regulations utilizing the ‘Reduction Method.’

A summary of the existing and proposed peak flows to each design point is provided in the tables below:

| Design Point #1: EDA-1 (DET.) (<i>Reduction Method Utilized</i>) | | | |
|---|---|-------------------------|----------------------------------|
| Frequency Storm Event | Total Existing Discharge of EDA 1 (DET.) (CFS) | Reduction Factor | Allowable Discharge (CFS) |
| 2 | 4.56 | 0.50 | 2.28 |
| 10 | 6.93 | 0.75 | 5.20 |
| 100 | 11.36 | 0.80 | 9.10 |

| Design Point #1: EDA-1 (UNDET.) (<i>Hydrograph Method Utilized</i>) | | | |
|--|---|-------------------------|----------------------------------|
| Frequency Storm Event | Total Existing Discharge of EDA 1 (UNDET.) (cfs) | Reduction Factor | Allowable Discharge (cfs) |
| 2 | 5.45 | 1.00 | 5.45 |
| 10 | 8.26 | 1.00 | 8.26 |
| 100 | 13.51 | 1.00 | 13.51 |

| Design Point #1: PDA-1 (DET.) (<i>Reduction Method Utilized</i>) | | | |
|---|--|----------------------------------|--|
| Frequency Storm Event | Existing Discharge to Point of Analysis from EDA 1 (DET.) (cfs) | Allowable Discharge (cfs) | Proposed Discharge to Point of Analysis (cfs) |
| 2 | 4.56 | 2.28 | 2.27 (<i>complies</i>) |
| 10 | 6.93 | 5.20 | 4.69 (<i>complies</i>) |
| 100 | 11.36 | 9.10 | 8.65 (<i>complies</i>) |

| Design Point #1: PDA-1 (UNDET.) (<i>Hydrograph Method Utilized</i>) | | | |
|--|--|----------------------------------|--|
| Frequency Storm Event | Existing Discharge to Point of Analysis from EDA 1 (UNDET.) (cfs) | Allowable Discharge (cfs) | Proposed Discharge to Point of Analysis (cfs) |
| 2 | 5.45 | 5.45 | 5.44 (<i>complies</i>) |
| 10 | 8.26 | 8.26 | 8.25 (<i>complies</i>) |
| 100 | 13.51 | 13.51 | 13.50 (<i>complies</i>) |

4.2 Water Quality & Groundwater Recharge

Water quality is being provided as part of this project via one (1) manufactured treatment device (MTD) located just downstream of the detention basin. The MTD is specified as a Contech Stormfilter device, which is NJDEP-certified to provide 80% TSS removal. The MTD has been sized for the water quality design flow utilizing the PondPack software.

Groundwater recharge meets the requirements of 7:8-5.4 by maintaining “100 percent of the average annual pre-construction groundwater recharge volume for the site.” Please see the Groundwater Recharge Spreadsheet located in Appendix E of this report.

4.3 *Soil Erosion*

Since this project will disturb more than 5,000 square feet, certification from the Warren County Soil Conservation District is required.

The plans depict the location and details for the following erosion controls:

1. Stabilized construction entrance to reduce the tracking of sediment onto paved roadway or other impervious surfaces;
2. Sediment barriers to intercept small amounts of sediment from unprotected areas of limited extent;
3. Storm sewer inlet protection to intercept and retain sediment, thus preventing the entrance of sediment into a storm sewer system; and
4. Temporary stockpile for the stripping of any topsoil for subsequent use on the project site.

4.4 *Stormwater Conveyance System*

The Rational Method was used for the design of the drainage conveyance system. All proposed piping conveys the 25-year storm event without surcharge above any grate elevation (please see Appendix B of this report).

5.0 MAINTENANCE

A stormwater operation & maintenance manual will be provided under separate cover for Town review as a condition of approval, after all necessary Town-required revisions are incorporated into the plan set and design.

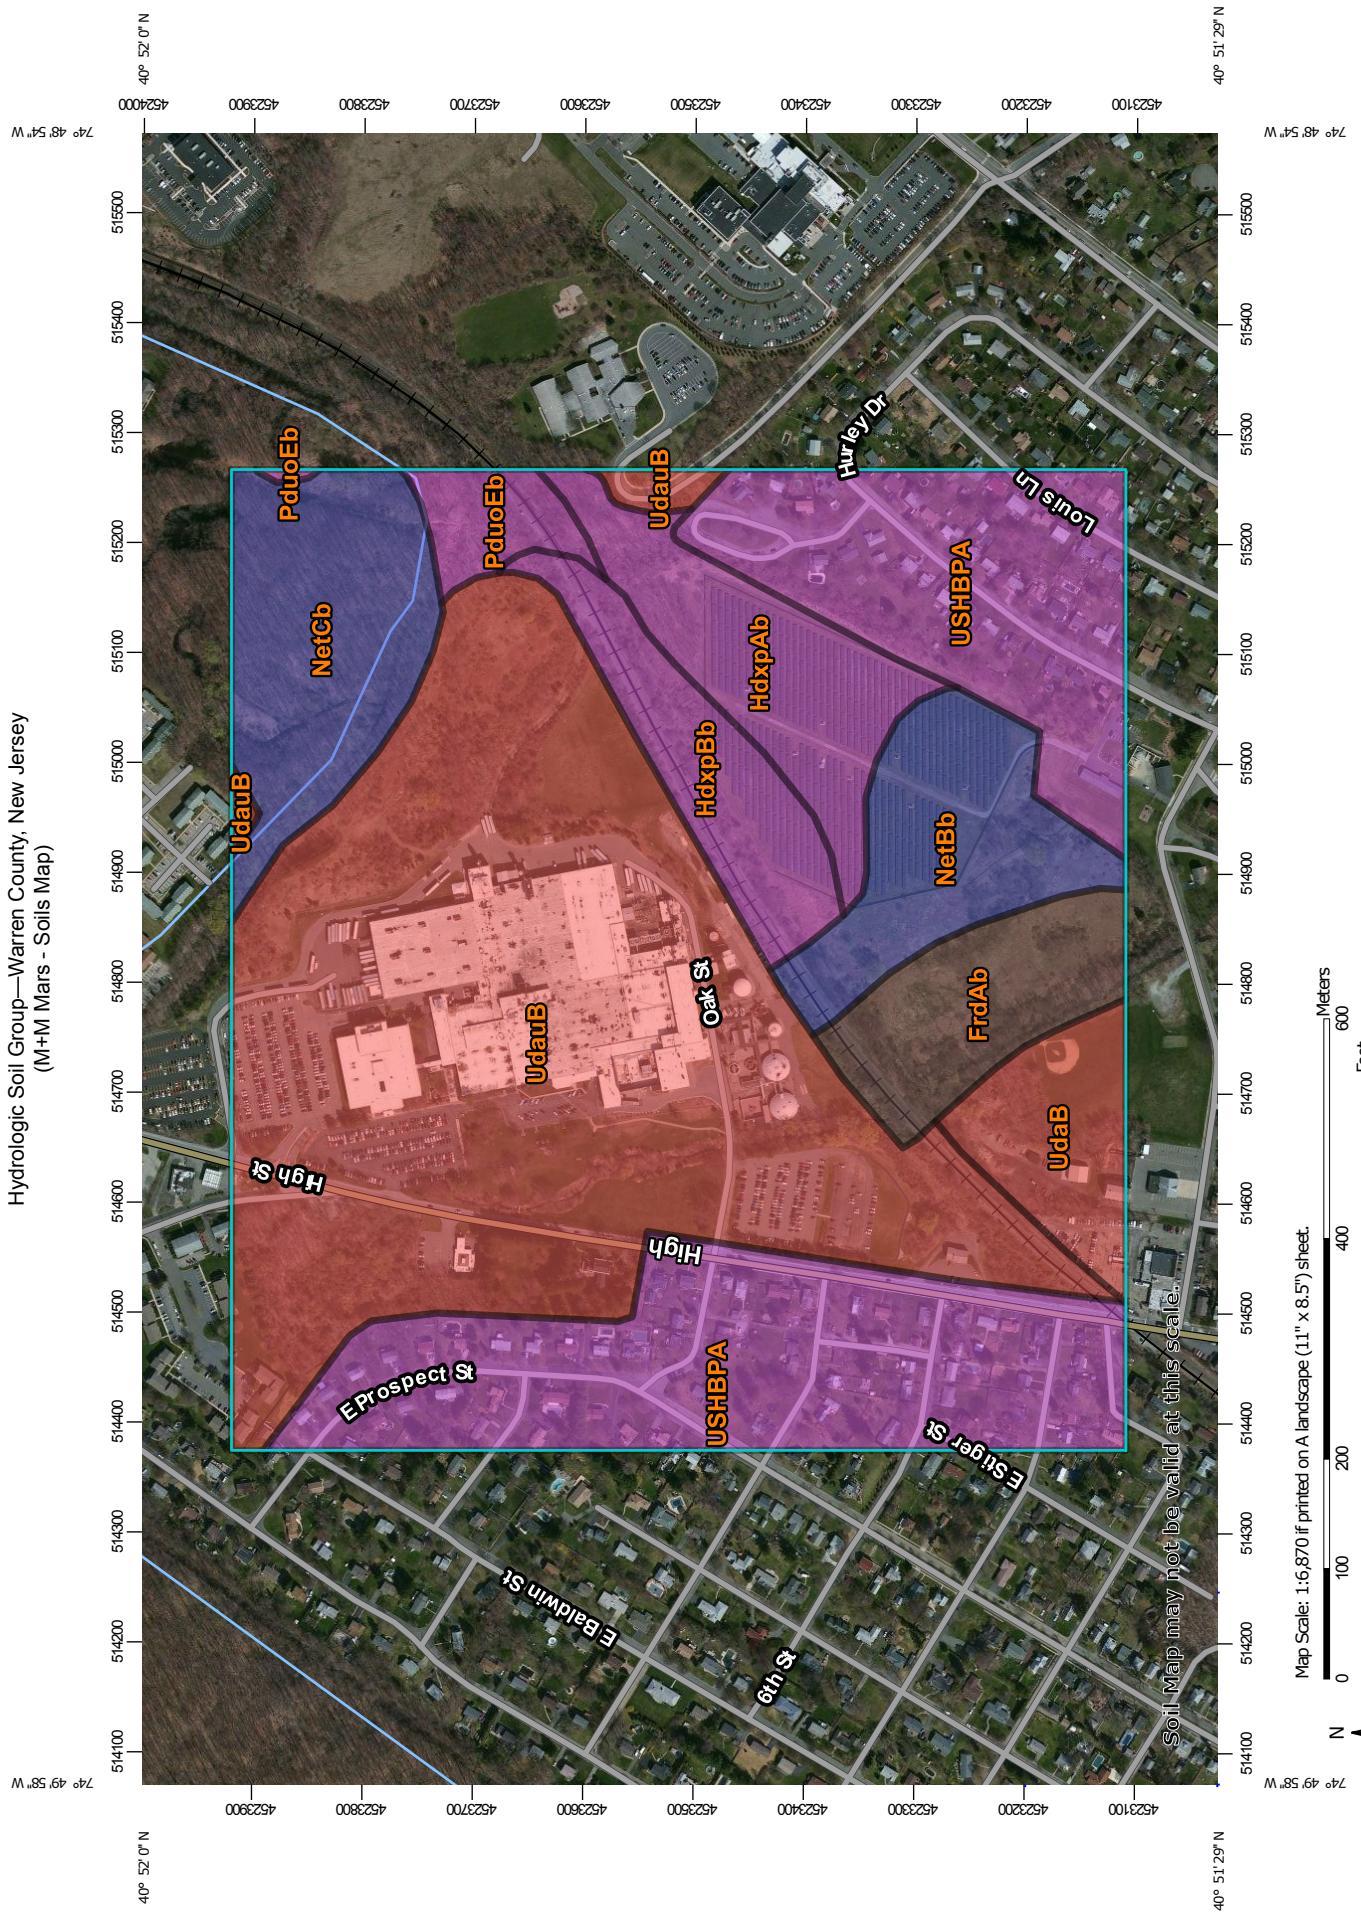

6.0 CONCLUSION

The proposed drainage design utilizes the most current standards and best management practices to support compliance with applicable regulations. The disturbed project areas have met the NJDEP requirements for each design storm, and therefore, the site is in compliance with the NJDEP stormwater quantity requirements. Water quality requirements have also been met to reduce TSS by 80% via a Contech MTD. Groundwater recharge requirements have been met and Low Impact Development techniques have been incorporated to the greatest extent practical. Lastly, soil erosion and sediment control certification are being sought from the WCSCD and the NJDEP.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:12,000.

Warning: Soil Map may not be valid at this scale.
Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Warren County, New Jersey
Survey Area Data: Version 13, Sep 14, 2018

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 26, 2011—May 1, 2011

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Component Percent Cutoff: None Specified

Tie-break Rule: Higher

Subsection: Time vs. Volume
Label: PO-1 (UG Basin)

Return Event: 1 years
Storm Event: WQ

Time vs. Volume (ac-ft)

Output Time increment = 0.05 hours

Time on left represents time for first value in each row.

Explanatory Notes-

-
- ¹ Approximate location of center of site, coordinates in state plane feet
 - ² Indicate who will be responsible for permanent operation and maintenance
 - ³ Additional Basin Detail Pages can be used for more than one basin in a project.
 - ⁴ Approximate location of center of basin, coordinates in state plane feet
 - ⁵ Indicate "design" for basins not yet constructed
 - ⁶ Drainage areas which are modified by construction, but not directed to the basin should still be listed and described
 - ⁷ "Outlet structure" means the control box, outlet headwall, FES etc. This does not refer to an individual control on the structure such as a weir or orifice. There are two tables for more than one outlet structure
 - ⁸ Approximate location of terminal discharge end of basin outfall, coordinates in state plane feet
 - ⁹ Indicate the type of outlet – weir, orifice, hydro brake, etc.
 - ¹⁰ Discharge Coefficient specific to the type of outlet control i.e., 0.6 for circular orifice
 - ¹¹ List the discharge equation for each outlet (weir, orifice etc) used
 - ¹² For basins with dead storage below the primary outlet, indicate 0 cfs discharge until the lowest outlet is reached. Routing table should begin at the lowest basin elevation.
 - ¹³ Describe NJDEP BMP Manual water quality devices such as seepage pits, rain gardens etc. Size is appropriate for device – cubic feet, square feet or linear feet. Location of device using state plane feet coordinates.

| | | | DRWC= 0.00 (in) |
| | | | EDRWC= 0.00 (in) |

Procedure to fill the Pre-Development and Post-Development Conditions Tables

For each land segment, first enter the area, then select TR-55 Land Cover, then select Soil. Start from the top of the table and proceed downward. Don't leave blank rows (with A=0) in between your segment entries. Rows with A=0 will not be displayed or used in calculations. For impervious areas outside of standard lots select "Impervious Areas" as the Land Cover. Soil type for impervious areas are only required if an infiltration facility will be built within these areas.

WATER QUALITY MTDS

StormFilter Design Summary

Mars Incorporated - Proposed Trailer Parking Lot

Hackkettstown, NJ

Information Provided by Engineer (Suburban Consulting Engineers, Inc.):

- Required TSS removal rate = 80%
- Treatment flow rate = 0.50 cfs
- 100-yr Storm bypass flow rate = TBD
- Impervious drainage area = 1.47 acres
- Presiding agency = NJDEP

StormFilter Information and Cartridge Data:

The Stormwater Management StormFilter® is a passive, siphon-actuated, flow-through stormwater filtration system consisting of a precast concrete structure that houses rechargeable, media-filled filter cartridges. The StormFilter works by passing stormwater through the media-filled cartridges, which trap particulates and adsorb pollutants such as dissolved metals, nutrients, and hydrocarbons. **The StormFilter has received final certification from the NJDEP for 80% TSS removal as a stand-alone treatment system.**

- StormFilter cartridge filter media = Perlite
- StormFilter cartridge media height = 27 inches (nominal)
- StormFilter cartridge surface area = 10.61 square feet (nominal)
- StormFilter cartridge specific treatment flow rate = 2.12 gallons/minute per square foot (nominal)
- StormFilter cartridge treatment flow = 22.5 gpm
- **Hydraulic head required: 3.0 feet (with 27 inch cartridge)**
- Minimum physical drop between inlet and outlet pipe = 6 inches

Design Summary:

The StormFilter is sized based on the NJDEP certification, which lists an approved treatment flow rate and maximum impervious acreage limit per cartridge in Table 1. The number of cartridges required based on the impervious drainage area is compared with the number of cartridges required based on the treatment flow rate; the larger number of cartridges governs the sizing.

The StormFilter for this site was sized to provide **11 cartridges** in order to meet the mass load requirement (calculations shown below). To house this number of cartridges, Contech Engineered Solutions recommends a 6' x 12' precast Peak Diversion StormFilter.

$$N_{cartridges \text{ hyd.load}} = \frac{Q_{treat} \times 449 \text{ gpm/cfs}}{Q_{cartridge}} = \frac{0.50 \text{ cfs} \times 449 \text{ gpm/cfs}}{22.5 \text{ gpm/cartridge}} = 9.97 \Rightarrow (10) 27" \text{ Cartridges}$$

$$N_{cartridges \text{ mass load}} = \frac{Area_{site}}{Max \text{ Area}_{cartridge}} = \frac{1.47 \text{ acres}}{.136 \text{ acres/cartridge}} = 10.81 \Rightarrow (11) 27" \text{ Cartridges}$$

StormFilter Design Summary

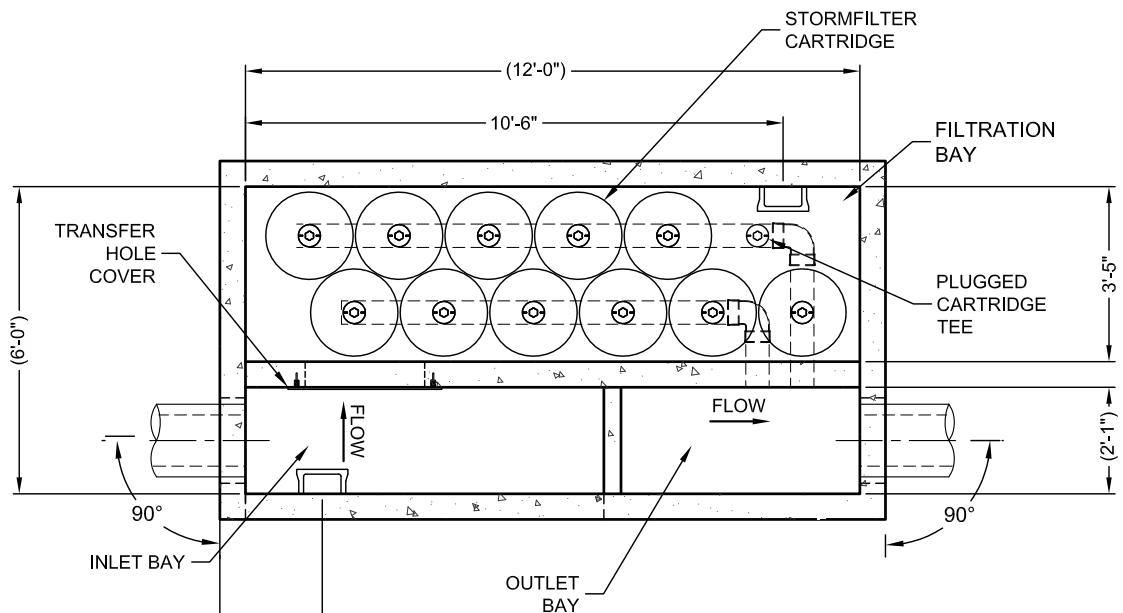

Maintenance:

Maintenance of Stormwater best management practices is required per the New Jersey Administrative Code 7:8-5.8. Recommendations for maintenance are included in chapters 8 & 9 of the New Jersey Stormwater Best Management Practices Manual. To comply with requirements, CONTECH offers a network of Preferred Service Providers that have the capability to perform all necessary inspections, compliance reporting and cleaning services. CONTECH recommends inspecting the system annually and maintaining the system at the recommendation of the annual inspection. Full maintenance is typically required every 24-36 months. Disposal of material should be handled in accordance with local regulations. Please contact CONTECH's Maintenance Department for all questions regarding maintenance at (503) 258-3157 or visit our website at www.conteches.com/maintenance.

Thank you for the opportunity to present this information to you and your client. If you have any questions, please call me at (410) 609-6140.

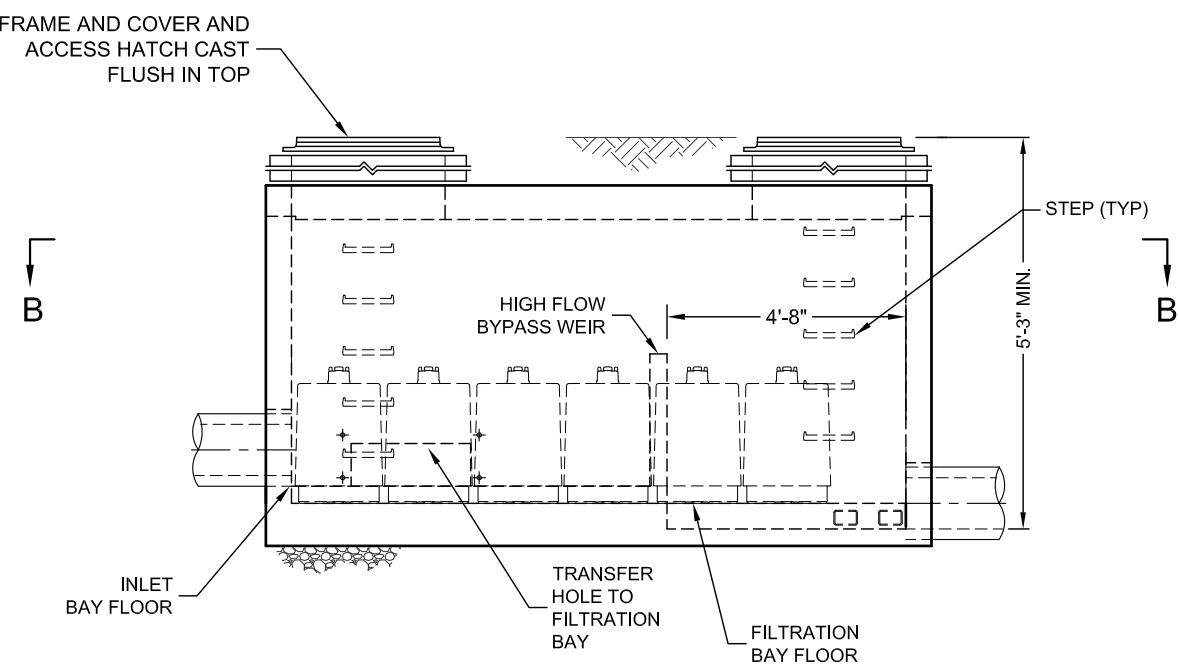

Sincerely,

Nicholas T. Busque, EIT

| | 7.5 | 10 | 5 |

FRAME AND COVER

(DIAMETER VARIES)

N.T.S.

PERFORMANCE SPECIFICATION

FILTER CARTRIDGES SHALL BE MEDIA-FILLED, PASSIVE, SIPHON ACTUATED, RADIAL FLOW, AND SELF CLEANING. RADIAL MEDIA DEPTH SHALL BE 7-INCHES. FILTER MEDIA CONTACT TIME SHALL BE AT LEAST 37 SECONDS. SPECIFIC FLOW RATE SHALL BE 2 GPM/SF (MAXIMUM). SPECIFIC FLOW RATE IS THE MEASURE OF THE FLOW (GPM) DIVIDED BY THE MEDIA SURFACE CONTACT AREA (SF). MEDIA VOLUMETRIC FLOW RATE SHALL BE 6 GPM/CF OF MEDIA (MAXIMUM).

GENERAL NOTES

1. CONTECH TO PROVIDE ALL MATERIALS UNLESS NOTED OTHERWISE.
2. DIMENSIONS MARKED WITH () ARE REFERENCE DIMENSIONS. ACTUAL DIMENSIONS MAY VARY.
3. FOR FABRICATION DRAWINGS WITH DETAILED STRUCTURE DIMENSIONS AND WEIGHTS, PLEASE CONTACT YOUR CONTECH REPRESENTATIVE. www.ContechES.com
4. STORMFILTER WATER QUALITY STRUCTURE SHALL BE IN ACCORDANCE WITH ALL DESIGN DATA AND INFORMATION CONTAINED IN THIS DRAWING. CONTRACTOR TO CONFIRM STRUCTURE MEETS REQUIREMENTS OF PROJECT.
5. STRUCTURE SHALL MEET AASHTO HS-20 LOAD RATING, ASSUMING EARTH COVER OF 0' - 5' AND GROUNDWATER ELEVATION AT, OR BELOW, THE OUTLET PIPE INVERT ELEVATION. ENGINEER OF RECORD TO CONFIRM ACTUAL GROUNDWATER ELEVATION. CASTINGS SHALL MEET AASHTO M306 AND BE CAST WITH THE CONTECH LOGO.

INSTALLATION NOTES

- A. ANY SUB-BASE, BACKFILL DEPTH, AND/OR ANTI-FLOTATION PROVISIONS ARE SITE-SPECIFIC DESIGN CONSIDERATIONS AND SHALL BE SPECIFIED BY ENGINEER OF RECORD.
- B. CONTRACTOR TO PROVIDE EQUIPMENT WITH SUFFICIENT LIFTING AND REACH CAPACITY TO LIFT AND SET THE STORMFILTER STRUCTURE (LIFTING CLUTCHES PROVIDED).
- C. CONTRACTOR TO INSTALL JOINT SEALANT BETWEEN ALL SECTIONS AND ASSEMBLE STRUCTURE.
- D. CONTRACTOR TO PROVIDE, INSTALL, AND GROUT PIPES. MATCH OUTLET PIPE INVERT WITH OUTLET BAY FLOOR.
- E. CONTRACTOR TO TAKE APPROPRIATE MEASURES TO PROTECT CARTRIDGES FROM CONSTRUCTION-RELATED EROSION RUNOFF.
- F. CONTRACTOR TO REMOVE THE TRANSFER HOLE COVER WHEN THE SYSTEM IS BROUGHT ONLINE.

Re: MTD Laboratory Certification
Stormwater Management StormFilter® (StormFilter) by Contech Engineered Solutions LLC
Off-line Installation

TSS Removal Rate 80%

Dear Mr. Berg:

The Stormwater Management rules under N.J.A.C. 7:8-5.5(b) and 5.7(c) allow the use of manufactured treatment devices (MTDs) for compliance with the design and performance standards at N.J.A.C. 7:8-5 if the pollutant removal rates have been verified by the New Jersey Corporation for Advanced Technology (NJCAT) and have been certified by the New Jersey Department of Environmental Protection (NJDEP). Contech Engineered Solutions LLC has requested a Laboratory Certification for the StormFilter System.

This project falls under the “Procedure for Obtaining Verification of a Stormwater Manufactured Treatment Device from New Jersey Corporation for Advanced Technology” dated January 25, 2013. The applicable protocol is the “New Jersey Department of Environmental Protection Laboratory Protocol to Assess Total Suspended Solids Removal by a Filtration Manufactured Treatment Device” dated January 25, 2013.

NJCAT verification documents submitted to the NJDEP indicate that the requirements of the aforementioned protocol have been met or exceeded. The NJCAT letter also included a recommended certification TSS removal rate and the required maintenance plan. The NJCAT Verification Report with the Verification Appendix for this device is published online at <http://www.njcat.org/verification-process/technology-verification-database.html>.

The NJDEP certifies the use of the StormFilter System by Contech Engineered Solutions LLC at a TSS removal rate of 80%, when designed, operated and maintained in accordance with the information provided in the Verification Appendix and subject to the following conditions:

1. The maximum treatment flow rate (MTFR) for the manufactured treatment device (MTD) is calculated using the New Jersey Water Quality Design Storm (1.25 inches in 2 hrs) in N.J.A.C. 7:8-5.5. The MTFR is calculated based on a verified loading rate of 2.12 gpm/sf of effective filtration treatment area.
2. The StormFilter System shall be installed using the same configuration as the unit tested by NJCAT, and sized in accordance with the criteria specified in item 6 below.
3. This device cannot be used in series with another MTD or a media filter (such as a sand filter), to achieve an enhanced removal rate for total suspended solids (TSS) removal under N.J.A.C. 7:8-5.5.
4. Additional design criteria for MTDs can be found in Chapter 9.6 of the New Jersey Stormwater Best Management Practices (NJ Stormwater BMP) Manual which can be found on-line at www.njstormwater.org.
5. The maintenance plan for a site using this device shall incorporate, at a minimum, the maintenance requirements for the StormFilter, which is attached to this document. However, it is recommended to review the maintenance website at <http://www.conteches.com/DesktopModules/Bring2mind/DMX/Download.aspx?EntryId=2813&PortalId=0&DownloadMethod=attachment> for any changes to the maintenance requirements.
6. Sizing Requirements:

The example below demonstrates the sizing procedure for a StormFilter System.

Example: A 0.25 acre impervious site is to be treated to 80% TSS removal using a StormFilter System. The impervious site runoff (Q) based on the New Jersey Water Quality Design Storm was determined to be 0.79 cfs or 354.58 gpm.

The calculation of the minimum number of cartridges for use in the StormFilter System is based upon both the MTFR and the maximum inflow drainage area. It is necessary to calculate the required cartridges using both methods and to rely on the method that results in the highest minimum number of cartridges determined by the two methods.

Inflow Drainage Area Evaluation:

The drainage area to the StormFilter System in this example is 0.25 acres. Based upon the information in Table 1 below, the following minimum number of cartridges are required in a StormFilter System to treat the impervious area without exceeding the maximum drainage area:

1. Five (5) 12" cartridges,
2. Three (3) 18" cartridges, or
3. Two (2) 27" cartridges

Maximum Treatment Flow Rate (MTFR) Evaluation:

The site runoff (Q) was determined based on the following:

$$\text{time of concentration} = 10 \text{ minutes}$$

$$i=3.2 \text{ in/hr (page 5-8, Fig. 5-3 of the NJ Stormwater BMP Manual)}$$

$$c=0.99 \text{ (runoff coefficient for impervious)}$$

$$Q=ciA=0.99 \times 3.2 \times 0.25=0.79 \text{ cfs}=0.79 \times 448.83 \text{ gpm}=354.58 \text{ gpm}$$

Based on a flow rate of 354.58 gpm, the following minimum number of cartridges are required in a StormFilter System to treat the impervious area without exceeding the MTFR:

1. Thirty-six (36) 12" cartridges,
2. Twenty-four (24) 18" cartridges, or
3. Sixteen (16) 27" cartridges

The MTFR Evaluation results will be used since that method results in the higher minimum number of cartridges determined by the two methods.

The sizing table corresponding to the available system models are noted below:

TABLE 1 STORMFILTER CARTRIDGE HEIGHTS AND NEW JERSEY TREATMENT CAPACITIES

| StormFilter Cartridge Heights and New Jersey Treatment Capacities | | | | |
|---|---------------------------------|-------------------------|-----------------------------|--|
| StormFilter Cartridge Height | Filtration Surface Area (sq.ft) | MTFR ¹ (GPM) | Mass Capture Capacity (lbs) | Maximum Allowable Inflow Area ² (acres) |
| Low Drop (12") | 4.71 | 10 | 36.3 | 0.061 |
| 18" | 7.07 | 15 | 54.5 | 0.09 |
| 27" | 10.61 | 22.5 | 81.8 | 0.136 |

Notes:

1. MTFR calculated based on $4.72 \times 10^{-3} \text{ cfs/sf}$ (2.12 gpm/sf) of effective filtration treatment area.

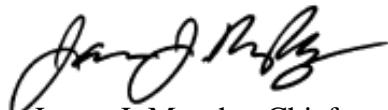

2. Based upon the equation found in the NJDEP Filter Protocol Maximum Inflow Drainage Area (acres) = weight of TSS before 10% loss in MTFR (lbs)/600 lbs/acre of drainage area annually.

Be advised a detailed maintenance plan is mandatory for any project with a Stormwater BMP subject to the Stormwater Management Rules, N.J.A.C. 7:8. The plan must include all of the items identified in Stormwater Management Rules, N.J.A.C. 7:8-5.8. Such items include, but are not limited to, the list of

indication of problems in the system, and training of maintenance personnel. Additional information can be found in Chapter 8: Maintenance and Retrofit of Stormwater Management Measures.

If you have any questions regarding the above information, please contact Shashi Nayak of my office at (609) 633-7021.

Sincerely,

James J. Murphy, Chief
Bureau of Nonpoint Pollution Control

StormFilter Inspection and Maintenance Procedures

Maintenance Guidelines

The primary purpose of the Stormwater Management StormFilter® is to filter and prevent pollutants from entering our waterways. Like any effective filtration system, periodically these pollutants must be removed to restore the StormFilter to its full efficiency and effectiveness.

Maintenance requirements and frequency are dependent on the pollutant load characteristics of each site. Maintenance activities may be required in the event of a chemical spill or due to excessive sediment loading from site erosion or extreme storms. It is a good practice to inspect the system after major storm events.

Maintenance Procedures

Although there are many effective maintenance options, we believe the following procedure to be efficient, using common equipment and existing maintenance protocols. The following two-step procedure is recommended::

1. Inspection

- Inspection of the vault interior to determine the need for maintenance.

2. Maintenance

- Cartridge replacement
- Sediment removal

Inspection and Maintenance Timing

At least one scheduled inspection should take place per year with maintenance following as warranted.

First, an inspection should be done before the winter season. During the inspection the need for maintenance should be determined and, if disposal during maintenance will be required, samples of the accumulated sediments and media should be obtained.

Second, if warranted, a maintenance (replacement of the filter cartridges and removal of accumulated sediments) should be performed during periods of dry weather.

In addition to these two activities, it is important to check the condition of the StormFilter unit after major storms for potential damage caused by high flows and for high sediment accumulation that may be caused by localized erosion in the drainage area. It may be necessary to adjust the inspection/maintenance schedule depending on the actual operating conditions encountered by the system. In general, inspection activities can be conducted at any time, and maintenance should occur, if warranted, during dryer months in late summer to early fall.

Maintenance Frequency

The primary factor for determining frequency of maintenance for the StormFilter is sediment loading.

A properly functioning system will remove solids from water by trapping particulates in the porous structure of the filter media inside the cartridges. The flow through the system will naturally decrease as more and more particulates are trapped. Eventually the flow through the cartridges will be low enough to require replacement. It may be possible to extend the usable span of the cartridges by removing sediment from upstream trapping devices on a routine as-needed basis, in order to prevent material from being re-suspended and discharged to the StormFilter treatment system.

The average maintenance lifecycle is approximately 1-5 years.

Site conditions greatly influence maintenance requirements.

StormFilter units located in areas with erosion or active construction may need to be inspected and maintained more often than those with fully stabilized surface conditions.

Regulatory requirements or a chemical spill can shift maintenance timing as well. The maintenance frequency may be adjusted as additional monitoring information becomes available during the inspection program. Areas that develop known problems should be inspected more frequently than areas that demonstrate no problems, particularly after major storms. Ultimately, inspection and maintenance activities should be scheduled based on the historic records and characteristics of an individual StormFilter system or site. It is recommended that the site owner develop a database to properly manage StormFilter inspection and maintenance programs..

Inspection Procedures

The primary goal of an inspection is to assess the condition of the cartridges relative to the level of visual sediment loading as it relates to decreased treatment capacity. It may be desirable to conduct this inspection during a storm to observe the relative flow through the filter cartridges. If the submerged cartridges are severely plugged, then typically large amounts of sediments will be present and very little flow will be discharged from the drainage pipes. If this is the case, then maintenance is warranted and the cartridges need to be replaced.

Warning: In the case of a spill, the worker should abort inspection activities until the proper guidance is obtained. Notify the local hazard control agency and Contech Engineered Solutions immediately.

To conduct an inspection:

Important: Inspection should be performed by a person who is familiar with the operation and configuration of the StormFilter treatment unit.

1. If applicable, set up safety equipment to protect and notify surrounding vehicle and pedestrian traffic.
2. Visually inspect the external condition of the unit and take notes concerning defects/problems.
3. Open the access portals to the vault and allow the system vent.
4. Without entering the vault, visually inspect the inside of the unit, and note accumulations of liquids and solids.
5. Be sure to record the level of sediment build-up on the floor of the vault, in the forebay, and on top of the cartridges. If flow is occurring, note the flow of water per drainage pipe. Record all observations. Digital pictures are valuable for historical documentation.
6. Close and fasten the access portals.
7. Remove safety equipment.
8. If appropriate, make notes about the local drainage area relative to ongoing construction, erosion problems, or high loading of other materials to the system.
9. Discuss conditions that suggest maintenance and make decision as to whether or not maintenance is needed.

Maintenance Decision Tree

The need for maintenance is typically based on results of the inspection. The following Maintenance Decision Tree should be used as a general guide. (Other factors, such as Regulatory Requirements, may need to be considered)

1. Sediment loading on the vault floor.
 - a. If >4" of accumulated sediment, maintenance is required.
2. Sediment loading on top of the cartridge.
 - a. If >1/4" of accumulation, maintenance is required.
3. Submerged cartridges.
 - a. If >4" of static water above cartridge bottom for more than 24 hours after end of rain event, maintenance is required. (Catch basins have standing water in the cartridge bay.)
4. Plugged media.
 - a. If pore space between media granules is absent, maintenance is required.
5. Bypass condition.
 - a. If inspection is conducted during an average rain fall event and StormFilter remains in bypass condition (water over the internal outlet baffle wall or submerged cartridges), maintenance is required.
6. Hazardous material release.
 - a. If hazardous material release (automotive fluids or other) is reported, maintenance is required.
7. Pronounced scum line.
 - a. If pronounced scum line (say \geq 1/4" thick) is present above top cap, maintenance is required.

Maintenance

Depending on the configuration of the particular system, maintenance personnel will be required to enter the vault to perform the maintenance.

Important: If vault entry is required, OSHA rules for confined space entry must be followed.

Filter cartridge replacement should occur during dry weather. It may be necessary to plug the filter inlet pipe if base flows is occurring.

Replacement cartridges can be delivered to the site or customers facility. Information concerning how to obtain the replacement cartridges is available from Contech Engineered Solutions.

Warning: In the case of a spill, the maintenance personnel should abort maintenance activities until the proper guidance is obtained. Notify the local hazard control agency and Contech Engineered Solutions immediately.

To conduct cartridge replacement and sediment removal maintenance:

1. If applicable, set up safety equipment to protect maintenance personnel and pedestrians from site hazards.
2. Visually inspect the external condition of the unit and take notes concerning defects/problems.
3. Open the doors (access portals) to the vault and allow the system to vent.
4. Without entering the vault, give the inside of the unit, including components, a general condition inspection.
5. Make notes about the external and internal condition of the vault. Give particular attention to recording the level of sediment build-up on the floor of the vault, in the forebay, and on top of the internal components.
6. Using appropriate equipment offload the replacement cartridges (up to 150 lbs. each) and set aside.
7. Remove used cartridges from the vault using one of the following methods:

Method 1:

- A. This activity will require that maintenance personnel enter the vault to remove the cartridges from the under drain manifold and place them under the vault opening for lifting (removal). Disconnect each filter cartridge from the underdrain connector by rotating counterclockwise 1/4 of a turn. Roll the loose cartridge, on edge, to a convenient spot beneath the vault access.

Using appropriate hoisting equipment, attach a cable from the boom, crane, or tripod to the loose cartridge. Contact Contech Engineered Solutions for suggested attachment devices.

- B. Remove the used cartridges (up to 250 lbs. each) from the vault.

Important: Care must be used to avoid damaging the cartridges during removal and installation. The cost of repairing components damaged during maintenance will be the responsibility of the owner.

- C. Set the used cartridge aside or load onto the hauling truck.
- D. Continue steps a through c until all cartridges have been removed.

Method 2:

- A. This activity will require that maintenance personnel enter the vault to remove the cartridges from the under drain manifold and place them under the vault opening for lifting (removal). Disconnect each filter cartridge from the underdrain connector by rotating counterclockwise 1/4 of a turn. Roll the loose cartridge, on edge, to a convenient spot beneath the vault access.
- B. Unscrew the cartridge cap.
- C. Remove the cartridge hood and float.
- D. At location under structure access, tip the cartridge on its side.
- E. Empty the cartridge onto the vault floor. Reassemble the empty cartridge.
- F. Set the empty, used cartridge aside or load onto the hauling truck.
- G. Continue steps a through e until all cartridges have been removed.

8. Remove accumulated sediment from the floor of the vault and from the forebay. This can most effectively be accomplished by use of a vacuum truck.
9. Once the sediments are removed, assess the condition of the vault and the condition of the connectors.
10. Using the vacuum truck boom, crane, or tripod, lower and install the new cartridges. Once again, take care not to damage connections.
11. Close and fasten the door.
12. Remove safety equipment.
13. Finally, dispose of the accumulated materials in accordance with applicable regulations. Make arrangements to return the used **empty** cartridges to Contech Engineered Solutions.

Related Maintenance Activities - Performed on an as-needed basis

StormFilter units are often just one of many structures in a more comprehensive stormwater drainage and treatment system.

In order for maintenance of the StormFilter to be successful, it is imperative that all other components be properly maintained. The maintenance/repair of upstream facilities should be carried out prior to StormFilter maintenance activities.

In addition to considering upstream facilities, it is also important to correct any problems identified in the drainage area. Drainage area concerns may include: erosion problems, heavy oil loading, and discharges of inappropriate materials.

Material Disposal

The accumulated sediment found in stormwater treatment and conveyance systems must be handled and disposed of in accordance with regulatory protocols. It is possible for sediments to contain measurable concentrations of heavy metals and organic chemicals (such as pesticides and petroleum products). Areas with the greatest potential for high pollutant loading include industrial areas and heavily traveled roads.

Sediments and water must be disposed of in accordance with all applicable waste disposal regulations. When scheduling maintenance, consideration must be made for the disposal of solid and liquid wastes. This typically requires coordination with a local landfill for solid waste disposal. For liquid waste disposal a number of options are available including a municipal vacuum truck decant facility, local waste water treatment plant or on-site treatment and discharge.

RE: Our Project No. 9145
Report of Subsurface Investigation
Storm Water Management Facility
New Trailer Storage Lot
Mars Chocolate North America
Hackettstown, New Jersey

Ladies and Gentlemen:

In accordance with our agreement, we have conducted a program of test pits and permeability testing at the above-reference site. The field work was conducted on January 28, 2019.

We reviewed basic geological data that has been published for this site. This information indicates that the site lies within a soil area containing older glacial ground moraine deposits. Predominant soil types are silty clays, silts and silty sands with variable concentrations of gravel, cobbles and boulders. In our experience, these materials exhibit rather low permeabilities. The glacial soils may be underlain at shallow (less than 10 feet) depths by limestone bedrock. The limestone bedrock can be highly pinnacled with the depth to rock varying greatly over short distances.

A copy of the USDA Soil Map provided for this analysis indicates that the soils at this site are mapped as Udaub (Udorthents-Urban land complex) and considered to be Hydrologic Soil Group D. Since this site is developed, deposits of fill are likely to be present. Historic aerial photos indicate previous regrading, including a possible former detention basin.

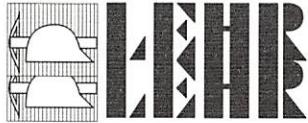

As part of this analysis, 4 test pits (TP-1 to TP-4) excavated to a maximum depth of 13 feet were inspected at 4 requested locations staked by your representative. Existing fill materials were encountered below the surface frost and grass, extending to depths of approximately 3 to 11 feet. The fill generally consisted of medium compact to compact sandy clay loam and loam with significant concentrations of gravel, cobbles and boulders as well as occasional asphalt and concrete fragments. At test pits TP-1 and TP-2, the fill was underlain by the possible original topsoil layer extending to depths of 7.5 to 10.5 feet. The underlying virgin soil generally consisted of sandy clay loam over loamy sands with gravel, cobbles, and boulders. Test pit TP-4 met refusal at a depth of 9 feet on a large boulder or possible limestone bedrock.

Included with this report are logs of the test holes and a location plan. Surface elevations at the test hole locations are based on topographic data provided by others.

Seepage of groundwater was noted at depths ranging from 4 to 5 feet, corresponding to approximate elevations ranging from +560 to +560.5 feet. No mottling was observed above this level. Thus, the estimated seasonal high groundwater elevation at the test pit locations ranges from +560 to +560.5 feet, requiring the bottom of basin to be above elevation +562.5 feet to maintain 2 feet of clearance from the groundwater level.

Five tube permeameter tests were conducted on undisturbed samples taken at depths of 3 to 9 feet in the test pits in accordance with procedures outlined in the NJ Stormwater BMP Manual, Appendix E (Soil Testing Criteria). Test results are included on the attached logs and the grain size analyses conducted on the materials.

The tests indicated permeability rates of $k = 0.006$ inch/hour to $k = 0.022$ inch/hour, all of which correspond to Soils Class K0 which is relatively impervious

and represents a restrictive layer. This also is consistent with Hydrologic Soil Group D as indicated in the published data. Based on the consistent test results and the agreement with the published data, similar conditions are anticipated throughout the project area. Thus, subsurface disposal of storm water does not appear to be feasible at this site due to the relatively impermeable soils above the observed water levels.

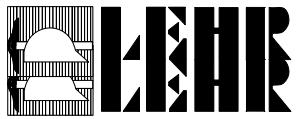

Please contact this office if you have any questions.

Very truly yours,

FRANK H. LEHR ASSOCIATES

TEST PIT LOG

PROJECT: New Trailer & Storage Lot **TEST PIT NO.:** TP-4
LOCATION: M&M Mars – Hackettstown, NJ **DATE PERFORMED:** 01/28/2019
INSPECTOR: MJS **PROJECT NO** 9145
WATER DEPTH: Slight Seepage @ 4.5'
 Moderate Seepage @ 7.5'

GROUND ELEV. 565± Feet

ESTIMATED SEASONAL HIGH GROUNDWATER DEPTH: 4.5' (approximate Elevation +560.5 feet)

| DEPTH (feet) | SAMPLE DESCRIPTION | REMARKS |
|-----------------|---|---------|
| | 6" Topsoil & Frost | |
| 1 | FILL: Dark Yellowish Brown (10YR 4/6) Sandy Clay Loam w/40% Gravel, frequent cobbles & occasional asphalt fragments | Compact |
| 2 | | |
| 3 | <i>NOTE: Thin Topsoil Layer @ 3'</i> | |
| 4 | Yellowish Brown (10YR 5/6) Clay Loam w/6% Gravel | Compact |
| 5 | Yellowish Brown (10YR 5/6) Sandy Clay Loam w/14% Gravel and occasional cobbles & boulders | Compact |
